## Abstract

Our team set out to solve the problem set forth by the Kaggle Quora Question Pairs challenge; that is, to use machine learning and data mining techniques to identify Quora questions with similar intent. We aimed to build a model that given a pair of questions, could reliably identify whether the questions were duplicates or not. We pursued several avenues to find the best solution, but in the end we identified several meaningful features from classifiers that analyzed shared and different words. Data was filtered strategically to remove noise, fed into these classifiers, and combined with a logistic regression model. Through this ensemble approach, we achieved 0.41 log-loss on our training data and 0.35 log-loss on our testing data.

## 1 Approaches explored

In this section we detail the various approaches that we explored before settling on our final solution.

### 1.1 Preprocessing

Our preprocessing is primarily carried out by our file parser, which takes the raw CSV files and pares it down to something that is easier for our main classifier to work with. It performs several modifications on the data while it is being parsed.

#### 1.1.1 Abbreviation substitution

One technique used by the parser is to look for common abbreviations and substitute in the expanded version. This is an extremely useful technique, since it provides the main classifier with more consistency across the data set.

#### 1.1.2 Stop words

Another technique that we explored was the removal of stop words in the data. This approach had both positive and negative ramifications: while it did reduce the amount of fluff in the data, it also

removed some intent-altering words, such as when, where, and why. Ultimately, it resulted in lower log-loss so we decided to include it in our final parser.

### **1.1.3 Punctuation**

In our initial implementation, the function written to strip punctuation did not do so properly, which was affecting our results significantly. However, when we changed it to strip all punctuation, we actually saw an increase in our log-loss. Further exploration revealed that this was caused by an interesting feature of the question pairs: in many cases, the last word of the question holds much greater weight with regard to the question's intent than the preceding words. By not removing the punctuation, we were unintentionally setting the last words apart since they were always considered by the classifier with the question mark included. In order to maintain this unexpected benefit without further complicating our classifier, we decided to remove all punctuation except for question marks. This gave us the lowest log-loss of all three configurations.

### **1.1.4 Spell checking**

## **1.2 Classifiers**

### **1.2.1 Naive Bayes**

### **1.2.2 Word embedding**

### **1.2.3 Support vector machine**

### **1.2.4 Convolutional neural network**

### **1.2.5 Long short-term memory network**

## **1.3 Features**

### **1.3.1 Common words**

### **1.3.2 Unique words**

### **1.3.3 Word rarity**

### **1.3.4 Word sentiment**

## **2 Results**

In this section we explore the final solution upon which we settled. While there are many classifiers that would perhaps be equally or better suited to solving this problem, we chose classifiers that we were more familiar with for our final solution, so we could optimize their results more knowledgeably.

## **3 Conclusion**

All headings should be lower case (except for first word and proper nouns), flush left, and bold.

First-level headings should be in 12-point type.

### **3.1 Headings: second level**

Second-level headings should be in 10-point type.

#### **3.1.1 Headings: third level**

Third-level headings should be in 10-point type.

**Paragraphs** There is also a `\paragraph` command available, which sets the heading in bold, flush left, and inline with the text, with the heading followed by 1 em of space.

## 4 Citations, figures, tables, references

These instructions apply to everyone.

### 4.1 Citations within the text

The `natbib` package will be loaded for you by default. Citations may be author/year or numeric, as long as you maintain internal consistency. As to the format of the references themselves, any style is acceptable as long as it is used consistently.

The documentation for `natbib` may be found at

<http://mirrors.ctan.org/macros/latex/contrib/natbib/natnotes.pdf>

Of note is the command `\citet`, which produces citations appropriate for use in inline text. For example,

```
\citet{hasselmo} investigated\dotso
```

produces

Hasselmo, et al. (1995) investigated...

If you wish to load the `natbib` package with options, you may add the following before loading the `nips_2017` package:

```
\PassOptionsToPackage{options}{natbib}
```

If `natbib` clashes with another package you load, you can add the optional argument `nonatbib` when loading the style file:

```
\usepackage[nonatbib]{nips_2017}
```

As submission is double blind, refer to your own published work in the third person. That is, use “In the previous work of Jones et al. [4],” not “In our previous work [4].” If you cite your other papers that are not widely available (e.g., a journal paper under review), use anonymous author names in the citation, e.g., an author of the form “A. Anonymous.”

### 4.2 Footnotes

Footnotes should be used sparingly. If you do require a footnote, indicate footnotes with a number<sup>1</sup> in the text. Place the footnotes at the bottom of the page on which they appear. Precede the footnote with a horizontal rule of 2 inches (12 picas).

Note that footnotes are properly typeset *after* punctuation marks.<sup>2</sup>

### 4.3 Figures

All artwork must be neat, clean, and legible. Lines should be dark enough for purposes of reproduction. The figure number and caption always appear after the figure. Place one line space before the figure caption and one line space after the figure. The figure caption should be lower case (except for first word and proper nouns); figures are numbered consecutively.

You may use color figures. However, it is best for the figure captions and the paper body to be legible if the paper is printed in either black/white or in color.

### 4.4 Tables

All tables must be centered, neat, clean and legible. The table number and title always appear before the table. See Table 1.

---

<sup>1</sup>Sample of the first footnote.

<sup>2</sup>As in this example.

Figure 1: Sample figure caption.

Table 1: Sample table title

Part		
Name	Description	Size ( $\mu\text{m}$ )
Dendrite	Input terminal	$\sim 100$
Axon	Output terminal	$\sim 10$
Soma	Cell body	up to $10^6$

Place one line space before the table title, one line space after the table title, and one line space after the table. The table title must be lower case (except for first word and proper nouns); tables are numbered consecutively.

Note that publication-quality tables *do not contain vertical rules*. We strongly suggest the use of the booktabs package, which allows for typesetting high-quality, professional tables:

<https://www.ctan.org/pkg/booktabs>

This package was used to typeset Table 1.

## 5 Final instructions

Do not change any aspects of the formatting parameters in the style files. In particular, do not modify the width or length of the rectangle the text should fit into, and do not change font sizes (except perhaps in the **References** section; see below). Please note that pages should be numbered.

## 6 Preparing PDF files

Please prepare submission files with paper size “US Letter,” and not, for example, “A4.”

Fonts were the main cause of problems in the past years. Your PDF file must only contain Type 1 or Embedded TrueType fonts. Here are a few instructions to achieve this.

- You should directly generate PDF files using `pdflatex`.
- You can check which fonts a PDF files uses. In Acrobat Reader, select the menu Files>Document Properties>Fonts and select Show All Fonts. You can also use the program `pdf fonts` which comes with `xpdf` and is available out-of-the-box on most Linux machines.
- The IEEE has recommendations for generating PDF files whose fonts are also acceptable for NIPS. Please see <http://www.emfield.org/icuwb2010/downloads/IEEE-PDF-SpecV32.pdf>
- `xfig` "patterned" shapes are implemented with bitmap fonts. Use "solid" shapes instead.
- The `\bbold` package almost always uses bitmap fonts. You should use the equivalent AMS Fonts:

```
\usepackage{amsfonts}
```

followed by, e.g., `\mathbb{R}`, `\mathbb{N}`, or `\mathbb{C}` for  $\mathbb{R}$ ,  $\mathbb{N}$  or  $\mathbb{C}$ . You can also use the following workaround for reals, natural and complex:

```
\newcommand{\RR}{\mathbb{R}} %real numbers
\newcommand{\Nat}{\mathbb{N}} %natural numbers
\newcommand{\CC}{\mathbb{C}} %complex numbers
```

Note that `amsfonts` is automatically loaded by the `amssymb` package.

If your file contains type 3 fonts or non embedded TrueType fonts, we will ask you to fix it.

## 6.1 Margins in L<sup>A</sup>T<sub>E</sub>X

Most of the margin problems come from figures positioned by hand using `\special` or other commands. We suggest using the command `\includegraphics` from the `graphicx` package. Always specify the figure width as a multiple of the line width as in the example below:

```
\usepackage[pdftex]{graphicx} ...
\includegraphics[width=0.8\linewidth]{myfile.pdf}
```

See Section 4.4 in the `graphics` bundle documentation (<http://mirrors.ctan.org/macros/latex/required/graphics/>)

A number of width problems arise when L<sup>A</sup>T<sub>E</sub>X cannot properly hyphenate a line. Please give LaTeX hyphenation hints using the `\-` command when necessary.

## Acknowledgments

Use unnumbered third level headings for the acknowledgments. All acknowledgments go at the end of the paper. Do not include acknowledgments in the anonymized submission, only in the final paper.
